Lecture 7

Dynamic games

Industrial
Economics

The Prisoners' dilemma

- ★ The Prisoners' dilemma is the **most useful game** in Industrial Organization
 - ◆ Two suspects are **accused** of committing a crime
 - ◆ They are both arrested and placed in **separate** cells
 - ◆ Each has been **asked to confess** to the crime
 - ◆ Confession by either suspect will make the work of the prosecutor easier, so, she is offering them a **deal**

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 2

Offer

The Prisoners' dilemma

		Clyde	
		Confess	Deny
Bonnie	Confess	-5, -5	-1, -10
	Deny	-10, -1	-2, -2

- ★ The **offer** of the prosecutor to each prisoner is
 - ◆ If you confess and your partner does not, you get 1 year and your partner 10
 - ◆ If you both confess, you get 5 years each
 - ◆ If you both deny, you get 2 years each

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 3

Prisoners' Dilemma – equilibrium

The Prisoners' dilemma

		Clyde	
		Confess	Deny
Bonnie	Confess	-5, -5	-1, -10
	Deny	-10, -1	-2, -2

- ★ The NE is (C,C) and it is **socially suboptimal**
- ★ Both players would accept to **collude** by moving to (D,D) as long as there is **commitment** to do so however, this game assumes **no commitment**
- ★ Players **prefer** to receive -5 rather than **expose** themselves to the danger of receiving -10

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 4

Repeated games

- ★ In repeated games, **two important things** may happen:
 1. Players can develop **reputations**
 2. Players have a chance for **retaliation**
- ★ Players may **jointly try to impose** an outcome that is better than the NE (but not NE)
 - ◆ There is **still incentive for cheating** in the static game
 - ◆ In the repetition process, though, this incentive may be **eliminated**
 - ◆ The cheater can get away with a **higher payoff** for **that** round
 - ◆ **BUT**, starting from the **next round**, the player who was cheated upon will **retaliate** by choosing the NE strategy

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 5

Tit-for-tat strategy

Repeated games

- ★ Retaliation is often called **tit-for-tat strategy**

"I trust you and play the collusive strategy but if you cheat, I will be playing the Nash strategy forever"
- ★ The tit-for-tat strategy is a **trigger strategy** everyone trusts everyone else **until** someone pushes the trigger
- ★ Once the trigger is **pushed**
 - ◆ The **cheater** loses **from next period** (social optimum → NE)
 - ◆ The **fair player** loses too but can't **trust** the cheater anymore
 - ◆ For the **fair player** the NE is better than to be cheated upon
- ★ Can repetition **lead to the collusive outcome** in a prisoners' dilemma type of game?

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 6

Repeated games

Indefinite repetition

- ★ What if the game is *infinitely* repeated or **randomly terminated**?
- ★ Tit-for-tat strategy **makes sense**
 - ◆ If a player *cheats*
 - ◆ The other player will be playing the *Nash strategy, forever*
 - ◆ The cheater will get high payoff for a *single period* but from the *next period* will revert to the lower Nash payoff
- ★ The **threat** of retaliation can be **credible**
iff the one-time payoff from cheating does not exceed the NPV of the infinite stream of NE payoffs.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 7

Repeated games

Sub-perfection

- ★ If a trigger strategy is **Nash** for the repeated game starting at period 1, it will be **also Nash** for the game starting at **any period**
because those games are *identical*
- ★ In this case, we say that the trigger is a **sub-game-perfect NE (SPNE)**
that is, a NE that *survives in every* sub-game that *includes it*.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 8

Repeated games

Finite repetition

- ★ What if the game is repeated a **known finite number** of times?
- ★ Lets take things **from the end**
 - ◆ In the last period there is **no possibility of retaliation**, thus, everyone will cheat
 - ◆ If everyone cheats in the last period, there is **no fear of retaliation** to the second to last period
 - ◆ So, there is **no retaliation** for any period
- ★ The **threat** of retaliation is **not credible**
collusion is **not sustainable**.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 9

Repeated games

Dynamic games of complete info

- ★ Consider a game between an entrant and an incumbent:

		Entrant (E)	
		Enter	Pass
Inc. (I)	Accommodate	1, 2	2, 0
	Fight	-1, -3	2, 0

- ★ What happens if the entrant **plays first**?
- ★ The incumbent can **threat** the entrant
if you 'enter' I will 'fight' – I may lose 1 but you will lose 3!
- ★ However, this threat will be **empty**
once the entrant has entered the incumbent will want to **accommodate**.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 10

Dynamic games

Credibility

- ★ The entrant **can understand** from the beginning that the threat is empty
so, will decide to **enter**
- ★ This threat has a **credibility** problem
if incumbent **played first**, things would be **different**
- ★ **Dynamic inconsistency**: A strategy may be optimal **ex ante** but sub-optimal **ex-post**, depending on the evolution of the game
the **problem** here is that the NE concept **cannot distinguish** empty threats.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 11

Dynamic games

Sequential rationality

- ★ The equilibrium concept in a dynamic game must satisfy **sequential rationality**
for each player, at every stage, strategy must be **optimal** from that node **and on**
- ★ This seems **easier** if
 1. We represent the game in a **tree form**
 2. Split it in smaller **sub-games** from each node
 3. Then, analyze it using **backward induction**
- ★ **Zermelo's theorem**: In every finite game of perfect info backward induction can **yield** a NE in pure strategies – if payoffs are asymmetric the equilibrium will be **unique**.

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 12

Dynamic games

Sub-game perfection

- ★ A **sub-game** is a subset of the game that begins with a node and includes **all consequent** nodes and branches every sub-game is a game **on its own**
- ★ **SPNE**: A profile of strategies that is a NE in every sub-game of this game that contains this profile
- ★ Intuition
 - ◆ The last game is a **standalone** game
 - ◆ As it results in a unique NE it may be **replaced** with its NE
 - ◆ This logic is applied then to the **next-to-last** game
- ★ Dynamic games are usually represented with a succinct **game tree**

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 13

Dynamic games

BMW vs. Benz: product choice problem

- ★ BMW and Mercedes each wish to **introduce a new type** of vehicle in the market
 - ◆ Either a **Compact Utility Vehicle (CUV)**
 - ◆ Or a **Compact Cabriolet (Cabrio)**
- ★ Firms will be better off if they introduce a **different type** of vehicle
 - ◆ Because the **demands** in those markets are small and **cannot accommodate** two competing sellers
 - ◆ Plus firms need to sell a **high quantity** to reach their MES
- ★ Decisions are **non-cooperative**

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 14

Dynamic games BMW vs. Benz

Product choice problem

		Mercedes	
		CUV	Cabrio
BMW	CUV	-6, -6	12, 10
	Cabrio	10, 12	-5, -5

- ★ If BMW **hears** that Mercedes is introducing a CUV, its best action is to produce a Cabrio
- ★ Bottom left corner is **Nash equilibrium**
- ★ What is **other** Nash Equilibrium?

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 15

Dynamic games BMW vs. Benz

Sequential moves

		Mercedes	
		CUV	Cabrio
BMW	CUV	-6, -6	12, 10
	Cabrio	10, 12	-5, -5

- ★ If both firms announce their decisions **independently** and **simultaneously**, they may both lose money
- ★ What if Mercedes **sped up** production and introduced a new model **first**?
 - ◆ Now there is a **sequential game**
 - ◆ BMW will have to **produce the opposite** of what Mercedes produced

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 16

Dynamic games BMW vs. Benz

Extensive form

		Mercedes	
		CUV	Cabrio
BMW	CUV	-6, -6	12, 10
	Cabrio	10, 12	-5, -5

- ★ The above bi-matrix does **not depict the game with clarity** anymore
- ★ We have to represent possible moves in the **extensive form** of a decision tree
this allows to **work backward** from the best outcome for BMW

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 17

Dynamic games BMW vs. Benz

Decision tree

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 18

Dynamic games

First-mover advantage

- ★ In some games the first-mover (leader) has **advantage**
in the *previous example* the company who would chose product first gained 12, while the follower only 10
- ★ The follower can **threaten** the leader
but an *empty threat* will **not reverse** the advantage
- ★ Lets now examine a strategy of **preemptive restriction** .

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 19

Dynamic games

Energon vs. Orange

		Orange (1 st)	
		Thin frame	Thick frame
Energon	Thin battery	3, 6	3, 0
	Thick battery	1, 1	8, 3

- ★ Orange Inc. produces **cellphones**
- ★ Energon produces **batteries** for cellphones
- ★ **Sequential game** with Orange as the **first-mover**
- ★ **Orange** does best by producing **thin cellphones**
Orange **knows** that Energon will **then** produce thin batteries
- ★ **Energon** prefers to make **thick batteries** .

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 20

Dynamic games Energon vs. Orange

Threat

		Orange (1 st)	
		Thin frame	Thick frame
Energon	Thin battery	3, 6	3, 0
	Thick battery	1, 1	8, 3

- ★ Can Energon **induce** Orange to produce **thick frames**?
recall that Energon *moves after* Orange
- ★ Suppose Energon **threatens** to produce thick batteries **regardless** what Orange does
not credible! – once Orange **has produced thin** frames, Energon **will lose** if carries out its threat
- ★ Can Energon **make the threat credible?** .

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 21

Dynamic games Energon vs. Orange

A credible threat

		Orange (1 st)	
		Thin frame	Thick frame
Energon	Thin battery	0, 6	0, 0
	Thick battery	1, 1	8, 3

- ★ **Energon burns down (!)** the production line of small batteries
- ★ Energon now can **credibly threaten** that it will produce "big batteries"
- ★ Of course, Energon wants to make sure that Orange executives **hear** about the fire ;) .

© 2017-18 Kosmas Marinakis, HSE IE - Lecture 7 22

Dynamic games

Irrationality

- ★ If a player gets the **reputation of being "irrational"** threats might be in fact credible
irrational individuals do **not** always make **profit maximizing** decisions
- ★ In some occasions reputation of irrationality can lead to a **significant advantage**
 - ◆ Opponents **cannot estimate** you with logic
 - ◆ Your **threats** will be taken more **seriously** .
