Lecture 10

Short-run GDP Fluctuations

Kosmas Marinakis, Ph.D.

Economics & Society

1

Previously in E&S…

- Definition of money
  - functions and properties of money
- Intrinsic value vs. fiat money
- The banking system
  - CB – commercial banks
- The money supply
- The money demand
  - for transactions – precaution – speculation
- Equilibrium interest rate and monetary policy
- Inflation

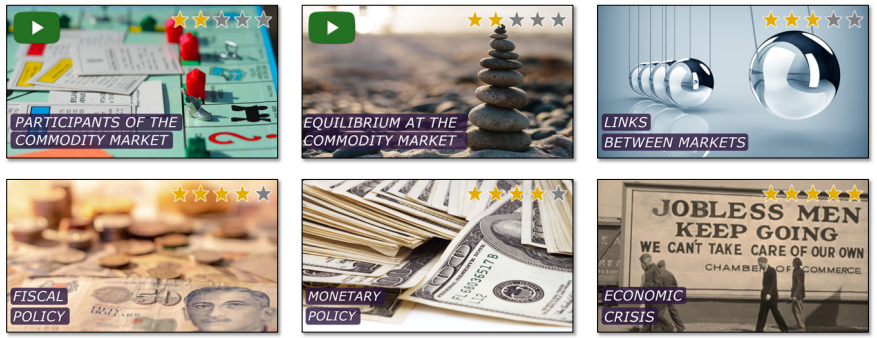
Short-run GDP Fluctuations



Lecture 10

3

18

Market interdependence

- So far, we have explored the markets of the macroeconomy as if they were ***independent*** and ***isolated*** from each-other
- Yet, there exist ***channels*** through which macro markets can ***affect*** each-other:
  - The _____ may ***affect*** the _____
  - The _____ may ***affect*** the _____ of companies
  - _____ may ***affect*** _____.
- Here, we will see how the commodity market and the money market are ***linked***

19

Investment & the real interest rate

- Imagine that there exist 14 ***investment projects*** for $100 each, expected to yield the following ***per year returns***:

  13%, 10%, 8%, 6%, 5%, 5%, 4%, 4%, 3%, 2%, 2%, 1%, 1%, 1%

- If you had $1,400, and the ***interest rate*** was 4.5%, how much would you invest?
- If you had $1,400, and the ***interest rate*** was 3.5%?
- If the ***interest rate*** was 2.5%?
- Investment is ***inversely related*** to the real interest rate ***[Link 2]***

20

Links between markets

- The commodity market and the money market are ***connected*** through ***2 links***:

LINK 1: COMMODITY MARKET: Increase in Y^* → MONEY MARKET: Increase in M_D

LINK 2: MONEY MARKET: Increase in r^* → COMMODITY MARKET: Decrease in I

21

22

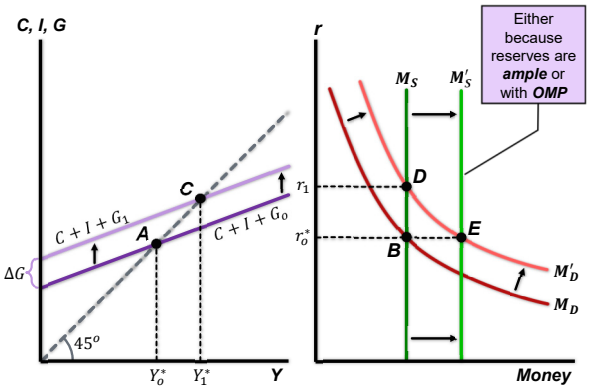
Fiscal policy

- The government can ***boost Y*** by either expanding G or contracting t
  these practices are known as ***Expansionary Fiscal Policy***
- Both alternatives may cause ***budget deficits***
  that is, $G > T$
- Deficits are ***funded*** by issuing ***government securities***
  effectively ***borrowing*** from households and firms at an ***interest***
- Past years' deficits ***pile up*** forming the ***government debt***
- If the ***"debt / GDP" ratio*** becomes too high, lenders will ***stop buying*** securities
  this may lead to a ***fiscal crisis***
- Decrease in G or increase in t are referred to as ***Contractionary Fiscal Policy***
  can ***help*** lower government debt or ease inflation

© 2019-23 Kosmas Marinakis, SMU

Link 1 with fiscal policy

- Commodity market ***equilibrates*** at Y_o^* and money market at r_o^*
- Fiscal policy (**G↑**) shifts the equilibrium in the commodity market to Y_1^*
- M_D ***shifts*** to M_D' **[L1]**
- r_o^* will tend to ***rise*** to r_1
- ***Unless*** M_S shifts to M_S'
  to ***keep*** the rate at r_o^*



© 2019-23 Kosmas Marinakis, SMU

Monetary policy

- The CB can ***intentionally trigger*** Link 2 to affect the economy
- Expansionary Monetary Policy:

  CB cuts r^* —LINK 2→ Increase in I → Increase in Y^*

  to stimulate the economic activity when a ***recession*** is feared
- Contractionary Monetary Policy:

  CB raises r^* —LINK 2→ Decrease in I → Decrease in Y^*

  to ***ease inflation*** by decreasing the money supply

© 2019-23 Kosmas Marinakis, SMU

Link 2 with monetary policy

- Markets initially ***equilibrate*** at Y_o^* and r_o^*
- CB ***cuts*** to r_1^* **[L2]**
- Investment ***increases*** to I_1:
  - ***Output*** rises to Y_1^* **[L1]**
  - M_D ***shifts*** to M_D'.
- ***Money supply*** must ***rise*** further to ***prevent*** the rate from rebounding to r_2 ▲▲

29

The 2007-09 Financial Crisis

- In the years before 2007 several new unregulated ***shadow banks*** had appeared
  those institutions started offering some new ***"innovative" financial products***
- One of those was to ***package together*** high-risk mortgage loans:
  - When you lend $1,000 at 5% to a ***single debtor*** with 2% risk of default, you face 98% probability to earn $50 and 2% probability of losing $1,000
  - When you lend $1 at 5% to ***1,000 debtors*** with each 2% risk of default, it is almost certain that you will earn around $29.
- This ***works great*** but it has ***3 important limitations***:
  1. The law of averages applies ***only in normal times***
  2. The "feeling of ***false safety***" made banks to neglect proper due diligence
  3. The over-supply of loans led the housing market to a ***speculative bubble*** ▲

30

History repeats itself

- In the first sight of ***recession, mortgage defaults*** snowballed
  - many banks had ***invested heavily*** in such MBS and could ***not survive the losses***
- Government and the Fed came to an ***ethical dilemma***:
  - have ***taxpayers cover*** the losses or let the economy ***sink***?
- The 2007-09 crisis was basically a ***repetition*** of the Great Depression:
  - In the Great Depression the bubble was the
  - In the 2007-09 Crisis the bubble was the
- Both happened because of ***regulation gaps*** in the financial markets
- The 2007-09 Crisis, however, ***lasted way less*** because it was extinguished successfully with ***expansionary policy***

The Greek Debt Crisis 2008 – today

- The Greek crisis was a ***national debt*** crisis
- During the 80s and 90s Greece was running on deficits
  - mainly ***financed with seignorage***
- In 2002 the country entered the ***Eurozone*** as a founding member:
  - Greece could ***no more*** fund its deficits by printing money
  - But it could finance its spending with ***cheap loans*** in its new currency.
- While the country was living lavishly on loans, ***debt kept piling up***
- By 2008 Greece had an official ***debt / GDP ratio at 115%***
  - in ***reality*** it was 127%
- At the same time, global financial crisis, made investors overly ***averse to risk***

© 2019-23 Kosmas Marinakis, SMU

The weak link

- Within months ***interest rates*** for Greek bonds exploded to 30%!
  - all outstanding Greek securities were ***rated as "trash"***
- Greece was in the ***middle of a deep recession*** with ***nothing*** to fight it:
  - Monetary policy was in the hands of the ECB
  - The government had no money to conduct fiscal policy.
- The IMF, the ECB and the European Commission ***bailed out*** urgent loans
  - under 2 ***conditions***: severe austerity and drastic reforms
- Within ***10 years***: GDP fell by 30%, unemployment exceeded 25%, infrastructure deteriorated, 6 governments were changed
  - the nation's ***morale*** collapsed
- Today, Greece has turned back to a ***catch-up economy***
